

Data Space & Digital Twins toward Climate-Resilient Infrastructures

The proposals from MINnD

Modélisation des INformations INteropérables
pour les INfrastructures Durables

- François Robida
- Vincent Keller
- Christophe Castaing

Agenda

1. Successes of MINnD season 2
2. MINnD's positions
3. Next steps towards a data space for construction

- › BIM for infrastructures
- › Launched in 2014, closing its second season NOW

How to define a process & data strategy at a territory scale ?

- Owners
- Engineering
- Contractors
- Laboratories
- Federations
- Software vendors
- Experts & Consultants
- Universities

/ Observatory / Project Mgmt

- WG0.1 - Development
- WG0.3 – Competences
- WG0.5 – Carbon impact

/ Data Structuring

- WG1.1 - IFC Bridge
- WG1.2 - IFC Rail
- WG1.3 - IFC Road
- WG1.4 - IFC Tunnel
- WG1.5 - IFC Geotechnic
- WG1.6 - IFC Earthworks
- WG1.7 - BIM & Archiving

/ Data Qualifying

- WG2.1 - Hand over modality
- WG2.2 - Uncertainties and tolerances management

Numerous (big)
deliverables to be
released by May 12th

/ Data Generation

- WG3.1 - PLM Integration during operation phase
- WG3.2 - Continuity BIM and Digital twin
- WG3.3 - Data management in collaboration mode

/ Data Collecting

- WG4.1 - Smart cities & IoT
- WG4.2 - Continuity of territory BIM-GIS

/ Data Using

- WG5.1 - Data Modeling (retro-engineering)

/ CDE - Collaboration

- WG6.2 - Collaboration platform & Platform collaboration
- WG6.3 - Project review

1. Targeting social & environmental & economical benefits at a territory scale
2. The strategy for digital twins and collaborative platforms in an open Common data environment
3. The crucial role of the owners
4. Digital continuity between BIM & GIS
5. The Implementation of IFC 4.3 & IFC4.4 is a crucial step forward
6. Carbon footprint of digital in construction

- › We have built a community that has worked in collaborative mode... and wishes to continue
- › Much remains to be done to implement all that has been produced
- › But we must also address the new challenges (climate, energy, circular economy, etc.)
- › Going from the scale of the building or the infrastructure to that of the city

- › From a technical point of view
 - Implement an interoperable collaborative platform model
 - Implement data space for construction (EU strategy – GAIA-X)
 - By developing digital commons

- › Extend the partnership
 - At the national level by mobilizing more widely the local authorities
 - At European level by developing initiatives and partnerships
 - And by continuing to bring the worlds of BIM and GIS closer together

MANIFEST january 2023

openBIM, Support toward ecological transition

To face the climate emergency, as recalled by the IPCC reports, construction stakeholders (Main contractors/ Builders/Operators/Maintainers) are committed to implementing a circular economy and achieving carbon neutrality by 2050. Digital tools allowing solutions to be proposed, trajectories to be simulated and progress to be monitored, are essential levers for ensuring this ecological transition.

- › **Ambition 1 : A COMMON VISION**
- › **Ambition 2 : A SHARED FRAMEWORK**
- › **Ambition 3 : A COMMON ROADMAP**

MANIFEST openBIM, Support toward ecological transition

CARBON AND DIGITAL IMPACT

The digital transition can only be efficient if it is in accordance with the common vision of the profession. As a reminder :

- open BIM and open CO2 guarantee full accessibility to data, sole guarantee of collaboration between actors and of efficiency during the different stages of a project.
- The data must be interoperable, usable in a sustainable way, and efficiently traced, for smooth exchanges and maximal trust between all project stakeholders.
- Clouds are necessary for sharing information but must be protected against third parties who could endanger the sovereignty, neutrality, reversibility, and ecological sobriety (in terms of data redundancy).
- The regulations must be supplemented and improved to protect all stakeholders' data, know-how and intellectual property.

A shared openBIM vision for ecological transition means embracing a common goal, including by the decision-makers. With the implementation of digital tools, this vision includes low-carbon trajectory monitoring for the lifetime of the infrastructure.

AMBITION 2 - A SHARED FRAMEWORK

In recent years, actors in the sector have developed and published a full set of standardisation documents. Principals can therefore rely on this complete corpus in the building, infrastructure, and territory fields. Some project owners and managers of built assets and territories have already implemented a proactive strategy prescribing the use of openBIM and digital tools. It is now time we establish these solutions. The particularly dynamic French construction ecosystem supports these transformations in a concerted and operational manner, with international partners and software publishers.

The current corpus acts on :

- Organizing the data around the objects to be built: IFC 4.3 standard, called ISO 15926¹ deals, among others, with all the territory's digital twin data and is the first to be implemented.
- Organizing data exchange processes, with the ISO 15926² standard, allowing the implementation of digital processes in contracts.
- Structuring business knowledge related to construction objects, with the ISO 23384³ standard. This text allows business experts to define object properties. The development of measurable performance indicators and quantitative reckoning will flow from it.

¹Document defining a common problem, published by ISO 4101 (IFC), ISO 15926 and other initiatives in 2021 "defining a digital representation that enhances the services and the impacts of the Public Works Sector"

² Geographic information system

³ ISO 15926-222 "Industry Foundation Classes (IFC) for data sharing in the construction and facilities management sectors"

⁴ ISO 15926 and its 6 chapters "Integration and digitization of information about buildings and civil engineering works, including building information modeling"

⁵ ISO 23384 "Building information modeling and other digital processes used in construction - Methodology to describe, author and maintain properties in interconnected data dictionaries"

⁵ ISO 23384 "Building information modeling and other digital processes used in construction - Methodology to describe, author and maintain properties in interconnected data dictionaries"

MANIFEST openBIM, Support toward ecological transition

AMBITION 3 - A COMMON ROADMAP

It is now high time for Public Procurement to fully play its role as a lever for ecological transition. All players must be motivated by it, to implement it through digital transformation⁴, during all phases of the development and life of the infrastructures. New frameworks and terms of reference to guide the call for tenders will be required, including for the operation/maintenance phases to best conduct and control the monitoring of the works. The terms of reference of the public calls for tenders (technical as well as administrative specifications) should :

- include technical specifications oriented towards openBIM and "open CO2" technologies;
- include specifications promoting the creation of digital twins as long-lasting digital assets;
- Optimize investments (CAPEX) and operating expenses (OPEX), and therefore the asset management of infrastructures, thanks to the technology available;
- integrate quantifiable, standardized, and transparent parameters for fair competition, while comparing bids;
- Integrate these indicators in rating systems for the purpose of promoting the best bidders in terms of carbon footprint and circular economy.

② Open BIM & Open CDE

Data sharing strategy at a territory scale : digital twins and collaborative platforms

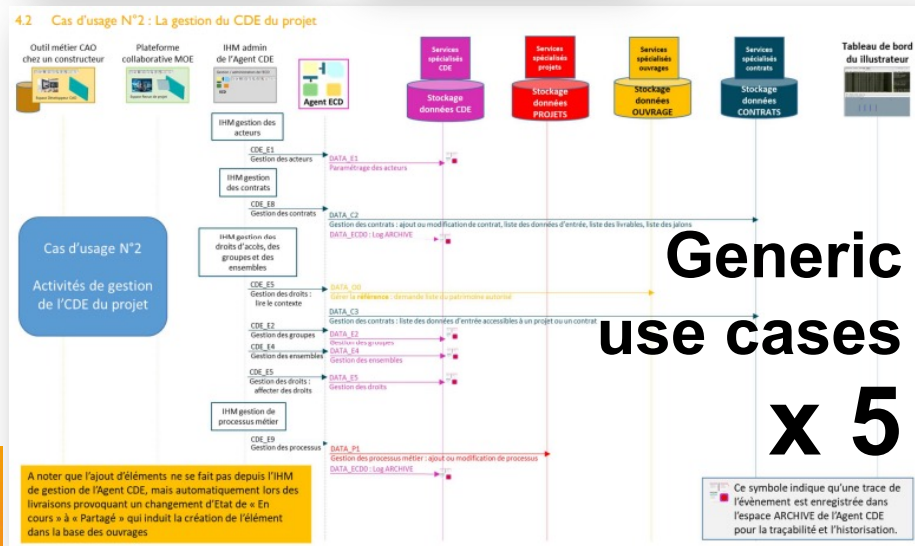

- The use of standardized data models to model physical assets as designed, as built or as maintained allows to generate valuable digital assets which can be massively used during their lifecycle by the numerous stakeholders & users with their preferred tools.
- Interoperability & data sustainability are key requirements from appointing parties to generate digital twins and to leverage them at a territory scale.
- That is the aim of the open BIM & specifically through the IFC model.

Welcome on the MINnD CDE illustrator

This tool has been designed to present the services exchanges that occur during within a digital environment managed by a CDE AGENT.

This is a sequential presentation, from use case 1 to use case 9. The use cases order cannot be changed.

At any time, you can restart this tool by clicking on the RESET button. Then by clicking on one USE CASE button, you can get the detailed information to run this use case within this tool.

By clicking on the buttons of the vertical menu, you can get access to the HMI (Human Machine Interface) of the different parts of the illustrator.

③ The crucial role of the owners

The owners as appointing parties have the power / responsibility to mandate / require,

- interoperable information
- for valuable usages.

The ecosystem actors as appointed parties develop & provide the means to implement as required.

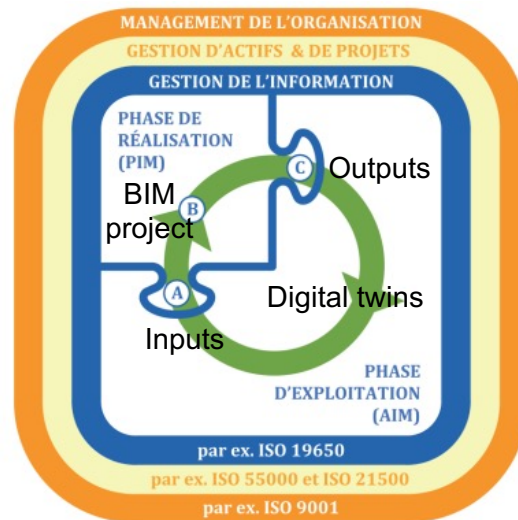

Information requirements (regulation or contractual)

NOTE Sur cette figure, « encapsule » signifie « fournit l'information à », « contribue à » signifie « fournit une information à », « spécifie » signifie « détermine le contenu, la structure et la méthodologie ».

Process

Légende

- AIM Modèle d'information de l'actif
- PIM Modèle d'information du projet
- A Début de la phase de réalisation – Transfert de l'information pertinente de l'AIM au PIM
- B Développement progressif du modèle de conception prévu dans le modèle de construction virtuelle
- C Fin de la phase de réalisation – Transfert de l'information pertinente au PIM à l'AIM

Figure 3 — Projet générique et cycle de vie de la gestion de l'information d'un actif

Deliverables > digital assets

Digital models

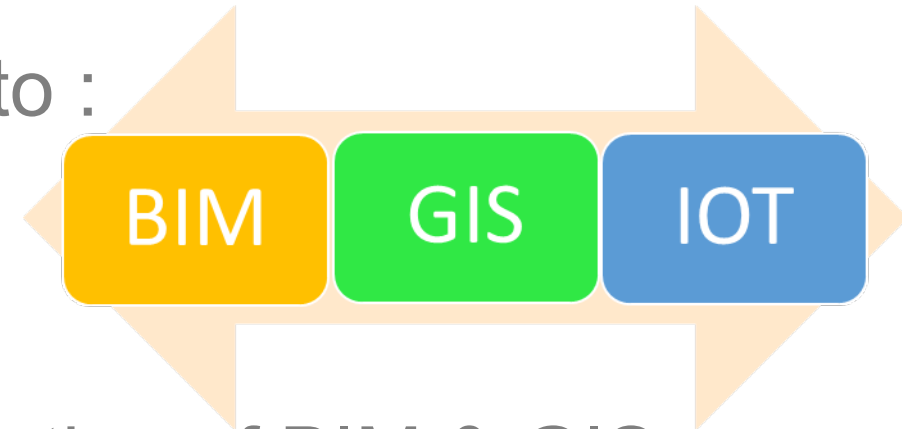

④ Digital continuity between BIM & GIS

Modèles BIM

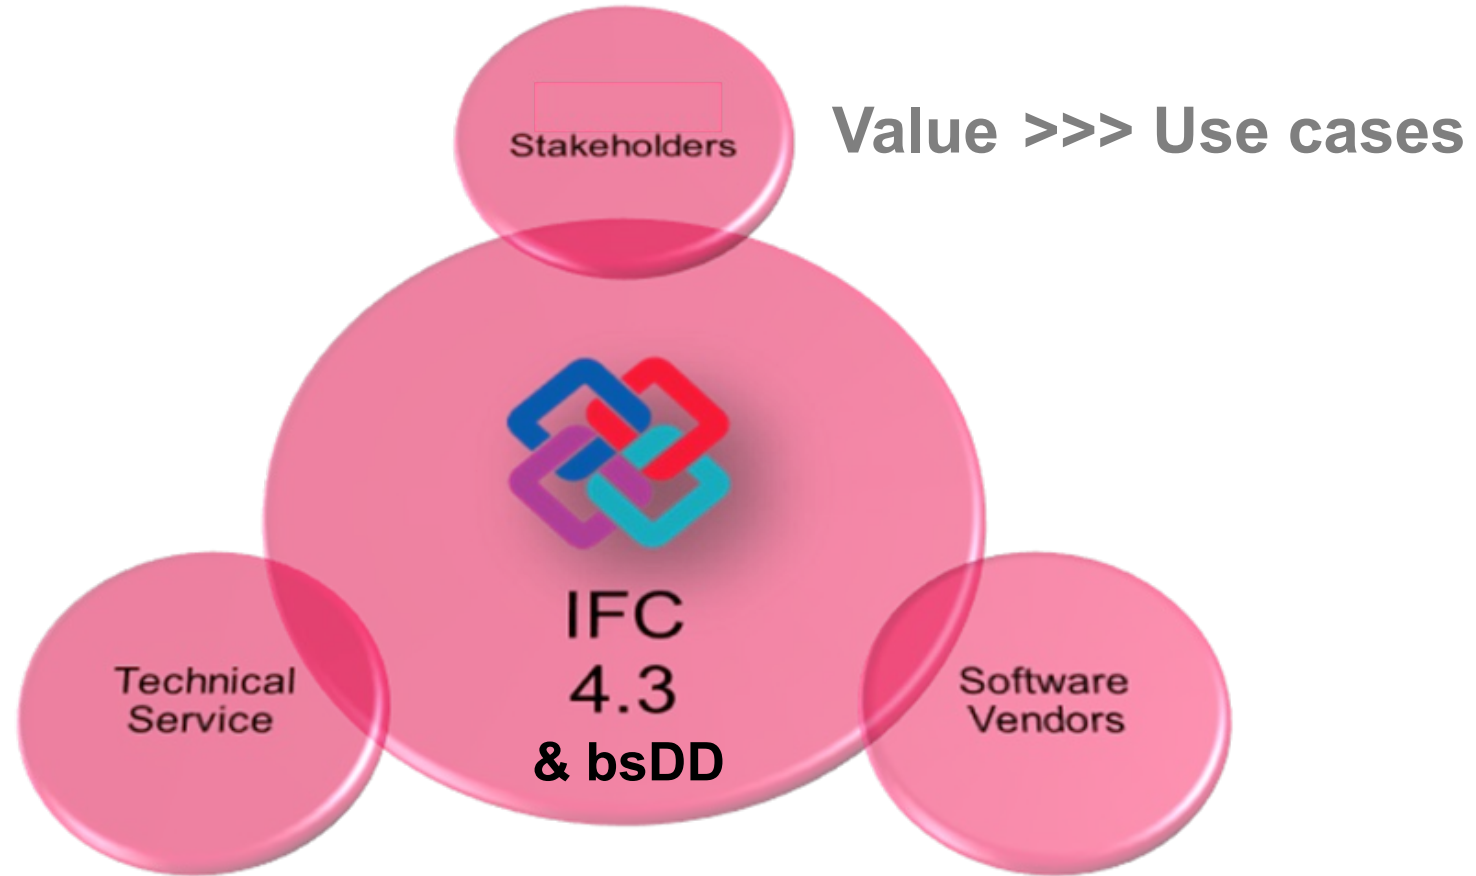

- › Federate the BIM / GIS conceptual modeling approaches
- › Federate the process of data sharing to :
 - Enhance the trust in the data
 - Enhance the useability of the data
- › Develop services leveraging the federation of BIM & GIS databases
- › Remove the (technological & human) barriers to change
- › Complies with an open CDE architecture

⑤ The Implementation of IFC 4.3 & IFC4.4 is a crucial step forward

Collaborate on the Rules > a common Framework
Compete on the Game > enable the Services

Leverage an Implementation platform to implement use cases (UC) > IDM/MVD/IDS

PAIN

1 use case (UC1)
is
not correctly specified
by appointing parties
and
not correctly supported
by existing tools
and
cannot be managed in IFC

GAIN

1 use case (UC1)
is
commonly specified
by appointing parties
and
implemented
by **several** software vendors
in **several** tools
by using the **IFC4.3** model
& **data dictionaries**

& train BIM/GIS/data managers & users !
