

GEOSPARC

HOW OPEN SOURCE AND INSPIRE CAN BE USED AS A TACTICAL WEAPON FOR ECONOMICAL GROWTH IN EUROPE

Dirk Frigne

May 26, 2015

Based on work in progress by Dirk Frigne, Torsten Friebe, Giacomo Martirano

Coffee

Appetizer (Assumptions)

Assumptions

- We know what GIS is
- We know what INSPIRE is
- We know what open source is
- We know everything about open source business models

Assumptions

- Wrong assumptions?
- Maybe:
- Some will not know what GIS is (I don't)
- Some will not know what INSPIRE is (I don't)
- Some will not know what open source is (I have some modest experience)
- Some will not know everything about open source business models (and also here some modest experience)

Very short: what is GIS?

A geographic information system (GIS) is a system designed to capture, store, manipulate, analyze, manage, and present all types of spatial or geographical data.

But being active for more than 15 years in the Geo-ICT industry, it is still hard for me to define the borders of the subject.

Different people have different perspectives.

Very short: what is INSPIRE?

fill (someone) with the urge or ability to do or feel something, especially to do something creative.

breathe in (air); inhale.

Different people have different perspectives.

What is the INSPIRE directive?

The INSPIRE directive aims to create a European Union (EU) spatial data infrastructure. This will enable the sharing of environmental spatial information among public sector organisations and better facilitate public access to spatial information across Europe.

My perspective: create the use cases possible with this directive in place

Very short: what is Open Source?

Open Source is a certification mark owned by the Open Source Initiative (OSI).

Developers of software that is intended to be freely shared and possibly improved and redistributed by others can use the Open Source trademark if their distribution terms are conform to the OSI's Open Source Definition.

Better speak about FLOSS: 'Free and libre'
Different people have different perspectives.

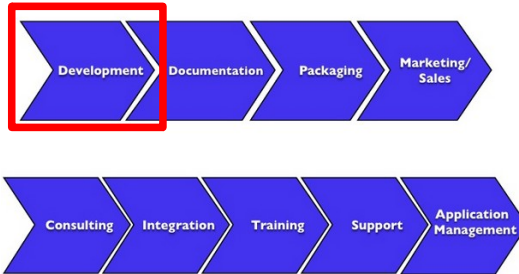

Very short: what are Open Source business models?

Software Value Chain

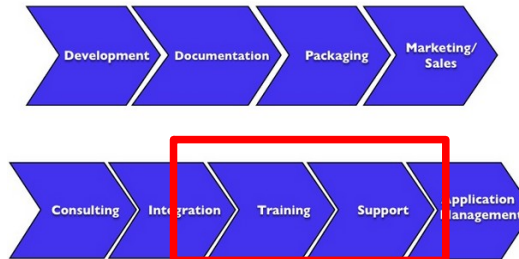

CASCADOSS: Model of Berlecon Research (2002)

Business models & open source

Dual-licensing

Support-selling

Platform provider

Consulting

Accessorizing

Software as a service

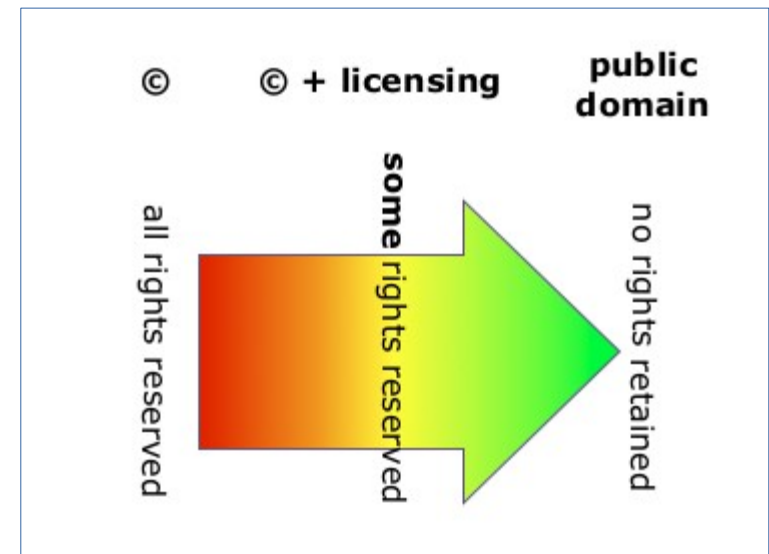

Licenses

The copyleft principle

License as weapon

Hotchpotch of observations (context)

Observations

Open source software is used by a lot of companies and organisations

Open source & proprietary

Today, Open source is used everywhere

- Webserver (Apache, Tomcat, ...)
- Android phone
- Apple computer

OSGeo Live Mix '10

web mapping

UMN MapServer

MapNik

GeoMajas

ZOO Project

MapFish

OpenLayers

Mapbender

Viking

Quantum GIS
MapServer

deegree

OpenStreetMap

MapGuide OS

GeoServer

GeoNetwork

metadata

Quantum GIS

GRASS GIS

Geopublisher

deegree GIS

KOSMO

GMT

FDO

GeoKettle

GeoTools

MetaCRS

SpatialLite

OSSIM

uDig

gvSIG

desktop GIS

GDAL/OGR

GEOS

PostGIS

libraries

Observations - Software Industry

- No big software companies in Europe
 - Although industry is large, also in Europe
- Many examples in US based companies
 - No big players in Europe (SAP, Nokia and TomTom being the bigger players)
 - Although: a lot of SME's producing software
 - (ex SMESpire)

Observations: OSS used by many

Google

Observations (Geo OSS projects)

- Many countries/ region have their own framework / project / (local) community
 - projects are more location based than we should expect
- OSGeo Webmapping examples
 - Deegree (focus in Germany)
 - Geomajas (focus in Belgium)
 - MapBender (focus in Germany)
 - MapFish (focus in France (CH))
- other examples:
 - gvSIG (focus in Spain)
 - Oskari (focus on Finland)

Observations (Project Funding)

- Many projects stop when funding stops
- Other projects never become an OSGeo project (why is not clear, should fulfill a couple of conditions, resulting in a 'quality label')
- Not many 'private' initiatives, by real entrepreneurs

Subroutine – real entrepreneurs

Real entrepreneurs

- Definition of real entrepreneurs (by Dirk Frigne):
 - fools who think they can change the world
 - and they really do!

Example of a Real entrepreneurs

- Mission to Mars of Elon Musk

Example of a Real entrepreneurs

Get the
INSPIRE solution!

Design → Transform → Manage → Publish → Analyse → View

Observations: new economy

- The world is changing
 - Environmental challenges
 - Migration challenges
 - Evolutionary challenges
- Software is becoming extremely important
- What is the future of software companies
 - More and more of the industry is based on software
 - Data (and predicting the future) are the next big evolutions where software becomes extremely important
- Free access to resources becomes extremely important

The main course (on Topic)

Subroutine 2 – Value of Obesity

The Value of obesity in the US

- Question: how many liter excess fat is there if every US-citizen should have only a body mass index of 25 (this is the upper limit of a healthy weight)
- Calculation by Daniel Reidpath:
 - 2.6 Billion Liter
 - Equals 1.038 Olympic Swimming pools
 - With this fat, it is possible to produce electrical energy for 90.000 Households
 - This has a value of 162 Million \$

Different people have different perspectives.

Software Industry is big business

- Software Industry – Facts and figures
 - Dixit BSA: Software industry USA: 261 B\$ (2007)
 - USA is world leader in Software Industry
 - 60% of global spending on PC software: USA Based companies (2008)

European (software) industry

- Europe is driven by SME's
 - > 99% of all European business are SME's
 - As a small company (SME), protection of your product is important (USP)
This can be your business model, a product, a service, etc....
 - Sharing information and co-creation is also important (working together)
 - How to combine these two contradictory demands?

Subroutine 3 – EGO vs ECO

EGO vs ECO

EGO

ECO

European FLOSS industry

- Build networking business as an ecosystem
 - Building communities
 - Respect and value are equally important
 - Yes we can!
 - But how?
 - By using open source (and in our case INSPIRE) as a tactical weapon for economical growth in Europe.
 - There is proof that open source generates value(1)
- <http://pt.slideshare.net/cdaffara/economic-value-of-open-source-14861646>

Open source software generates value

- But ...
- Already a good and interesting trend, but still 13% of the total budget flows to US licenses

So ...

- Europe should have the ambition to become also a major player in this industry

Europe SME Open source Industry

European FLOSS industry

- Answer: using OSS with a protective OSS license (to be discussed and validated)
 - Using a more protective license such as GPL or AGPL has some benefits:
 - The party investing in the software remains the owner.
 - Protect the investment through the copyleft mechanism:
 - or it remains open source and shared
 - or there should be some return on investment if used in a proprietary way.

European FLOSS industry

- Investments in FLOSS in AGPL or GPL could be used to give the users the choice to use the technology in an open way,
- or use them in a closed way through the protection mechanism, possible with the copyleft principle. In this case, the user should donate something in place.
- For industry outside Europe this can be a license fee payed to the investor (SME, Europe, ...)
- For the industry inside Europe, this can be part of a subsidiary plan in an H2020 context.

Dessert Conclusions and takeaway

Conclusions

- We should have the ambition in Europe to create a strong software eco-system, based on FLOSS.
- INSPIRE is an interesting scale to test this for the whole industry.
- Work is already in progress to evolve in this direction (SMESpire initiative, AR3NA initiative, ...)
- This presentation has only the ambition to start the discussion and will be published on my personal blog (www.frigne.be)

Discuss during further coffee time?
