## INSPIRE data themes

ArcGIS for INSPIRE provides geodatabase templates

# Geodatabase Implementation for INSPIRE

- **Started with INSPIRE UML, not GML Schema**
  - So work from conceptual schema
  - Model reflects IR specs - not affected by downstream detail changes
- **What goals? Designed to maximize the use of the data beyond just view:**
  - Compliance tests
  - Quality Assurance
  - Cartography
  - Time-aware layers
  - REST services
  - Analysis
  - Extensible

# Generating the physical Esri geodatabase Implementation

## Annex I

- For Annex I themes, all steps were automated
  - Resultant database good for INSPIRE services, but not optimal for analysis etc

# Generating the physical Esri geodatabase Implementation

Annex II & III

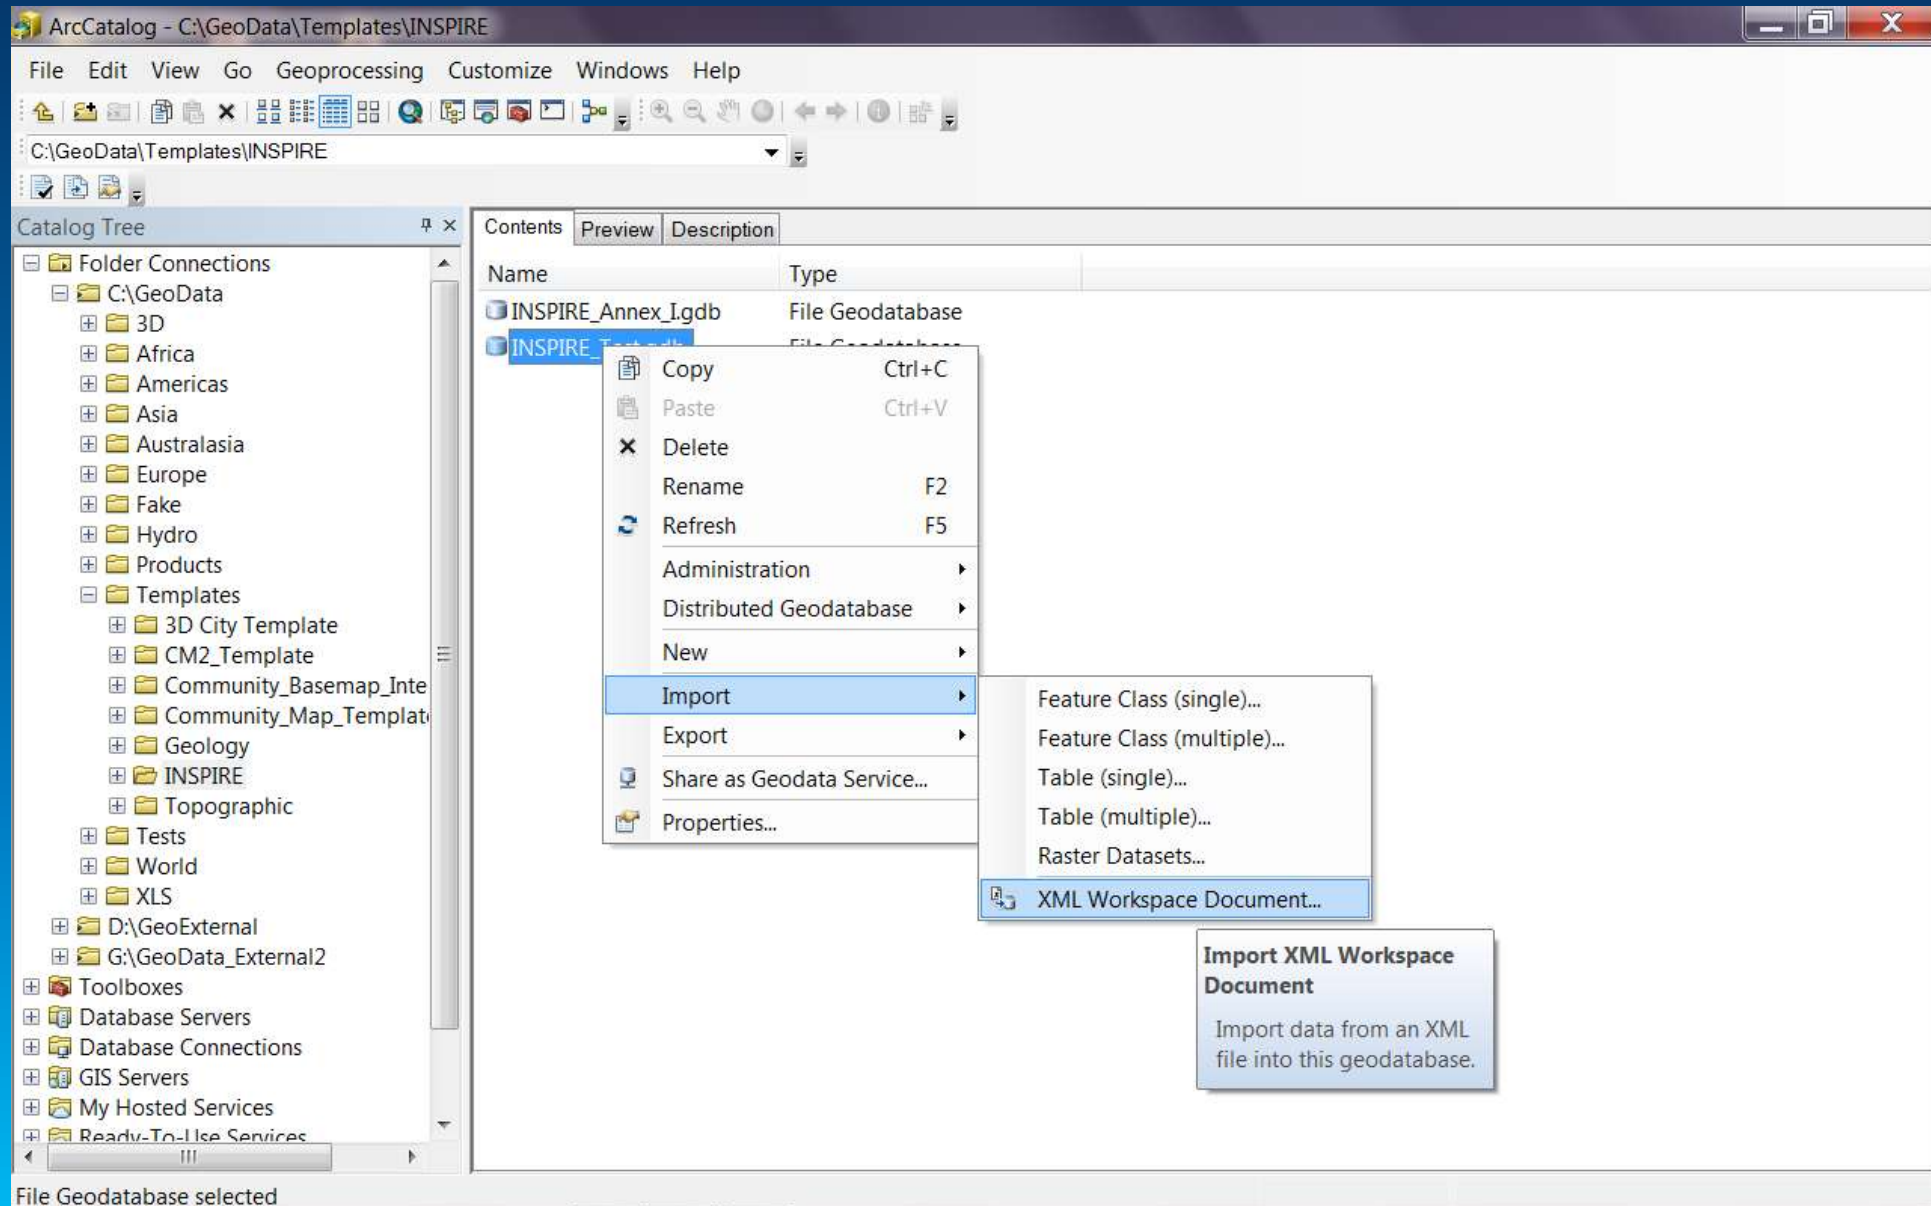

- **For Annex II & III themes (GE, LC), more options requiring human decisions**
  - So step 1 was more manual, using Enterprise Architect
  - Resultant database is more useable by GIS functionality

# ArcGIS for INSPIRE – Schema XML

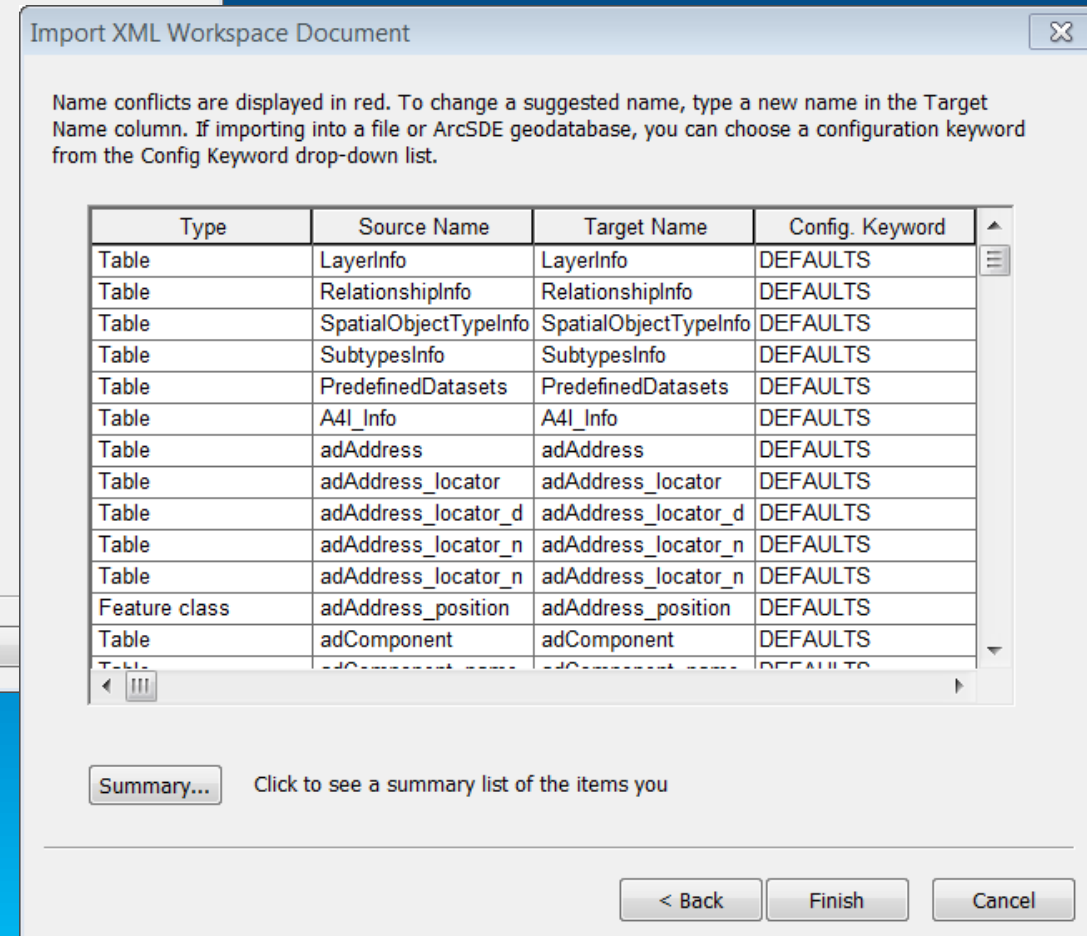

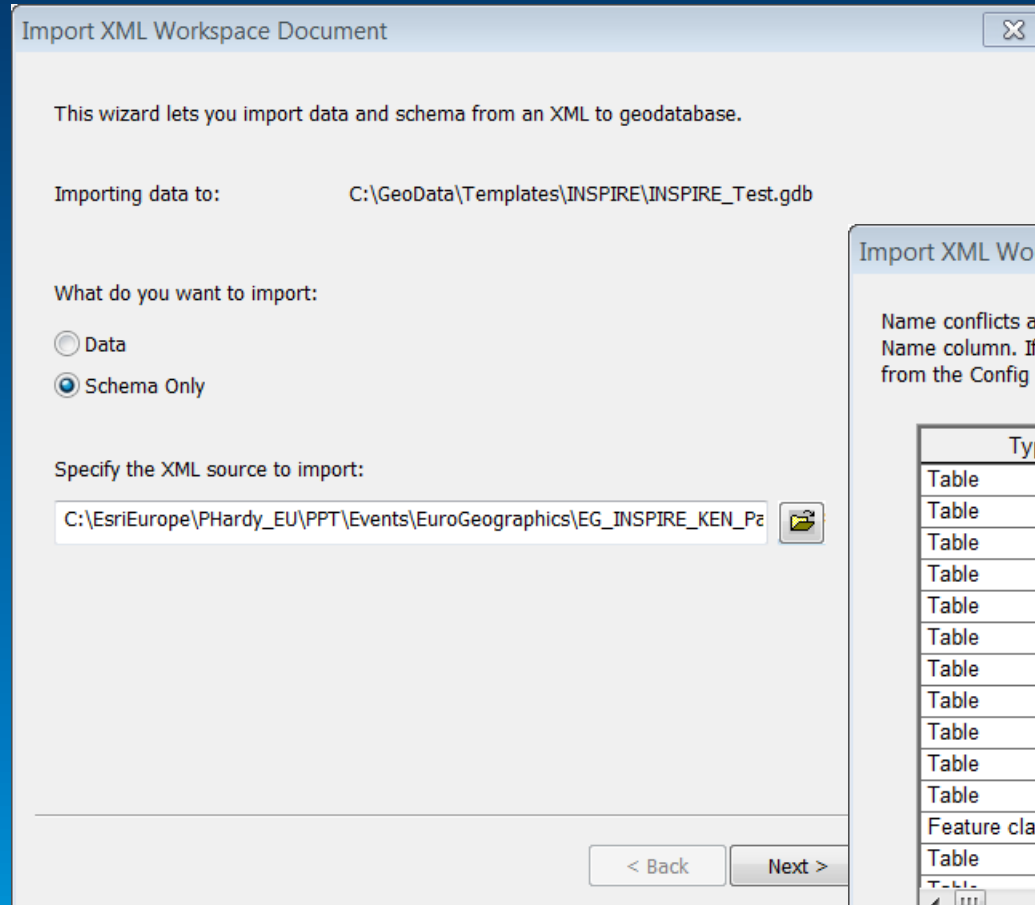

```
</DataElement>
- <DataElement xsi:type="esri:DEFeatureClass">
  <CatalogPath>/FC=auAdmBoundaryL</CatalogPath>
  <Name>auAdmBoundaryL</Name>
  <DatasetType>esriDTFeatureClass</DatasetType>
  <DSID>2</DSID>
  <Versioned>>false</Versioned>
  <CanVersion>>true</CanVersion>
  <HasOID>>true</HasOID>
  <OIDFieldName>OBJECTID</OIDFieldName>
  - <Fields xsi:type="esri:Fields">
    - <FieldArray xsi:type="esri:ArrayOfField">
      - <Field xsi:type="esri:Field">
        <Name>OBJECTID</Name>
        <Type>esriFieldTypeOID</Type>
        <IsNullable>>false</IsNullable>
        <Length>4</Length>
        <Precision>0</Precision>
        <Scale>0</Scale>
        <Required>>true</Required>
        <Editable>>false</Editable>
        <AliasName>Unique identifier</AliasName>
        <ModelName>OBJECTID</ModelName>
      </Field>
      - <Field xsi:type="esri:Field">
        <Name>IFCID</Name>
        <Type>esriFieldTypeInteger</Type>
        <IsNullable>>false</IsNullable>
        <Length>4</Length>
        <Precision>0</Precision>
        <Scale>0</Scale>
        <Required>>true</Required>
        <Editable>>true</Editable>
        <AliasName>ArcGIS for INSPIRE identifier, used in references to the object/feature</AliasName>
        <ModelName>IFCID</ModelName>
      </Field>
      - <Field xsi:type="esri:Field">
        <Name>SHAPE</Name>
        <Type>esriFieldTypeGeometry</Type>
```

## ArcGIS for INSPIRE

**Current Version:** 10.3 **Released:** December 2014

ArcGIS for INSPIRE is the solution for preparation of harmonized spatial data via standardized services pursuant to the guidelines of the INSPIRE specification. It provides mechanisms to efficiently store transformed data and distribute service-based data via the INSPIRE View and Download services.

### Implement INSPIRE Data Models

Geodatabase templates, which implement the INSPIRE data specifications, are provided as part of the solution. An essential element of INSPIRE is the data model specification that provides a uniform way to view and download geographic datasets shared in the INSPIRE network by European Member States.

[ArcGIS for INSPIRE geodatabase templates >](#)

### Share, Discover, and Consume INSPIRE Resources

Geoportal allows you to create, manage, and use INSPIRE compliant metadata, expose metadata via INSPIRE Discovery services, and create and customize metadata profiles to meet additional national requirements.

### Publish INSPIRE Services

Author maps and publish View and Download services compliant with INSPIRE specifications.

[Create INSPIRE services >](#)

### Not Ready for Data Harmonization?

ArcGIS for INSPIRE enables you to deliver INSPIRE View and Download services for non-harmonized data. Discover how you can add non-INSPIRE data to a map, and create feature download services and predefined dataset services with as is data.

Available in multiple languages

## Data Dictionary for INSPIRE Land Cover Theme

The geodatabase template for Land Cover implements the INSPIRE LandCoverNomenclature schema and LandCoverVector schema within the Land Cover Theme, LandCoverRaster schema is not included yet.

To view the geodatabase model diagram, please refer to [lc\\_model.pdf](#).

ShapeType	Polygon
FeatureType	Simple
UseM	false

# Mapping INSPIRE schema to Geodatabase schema

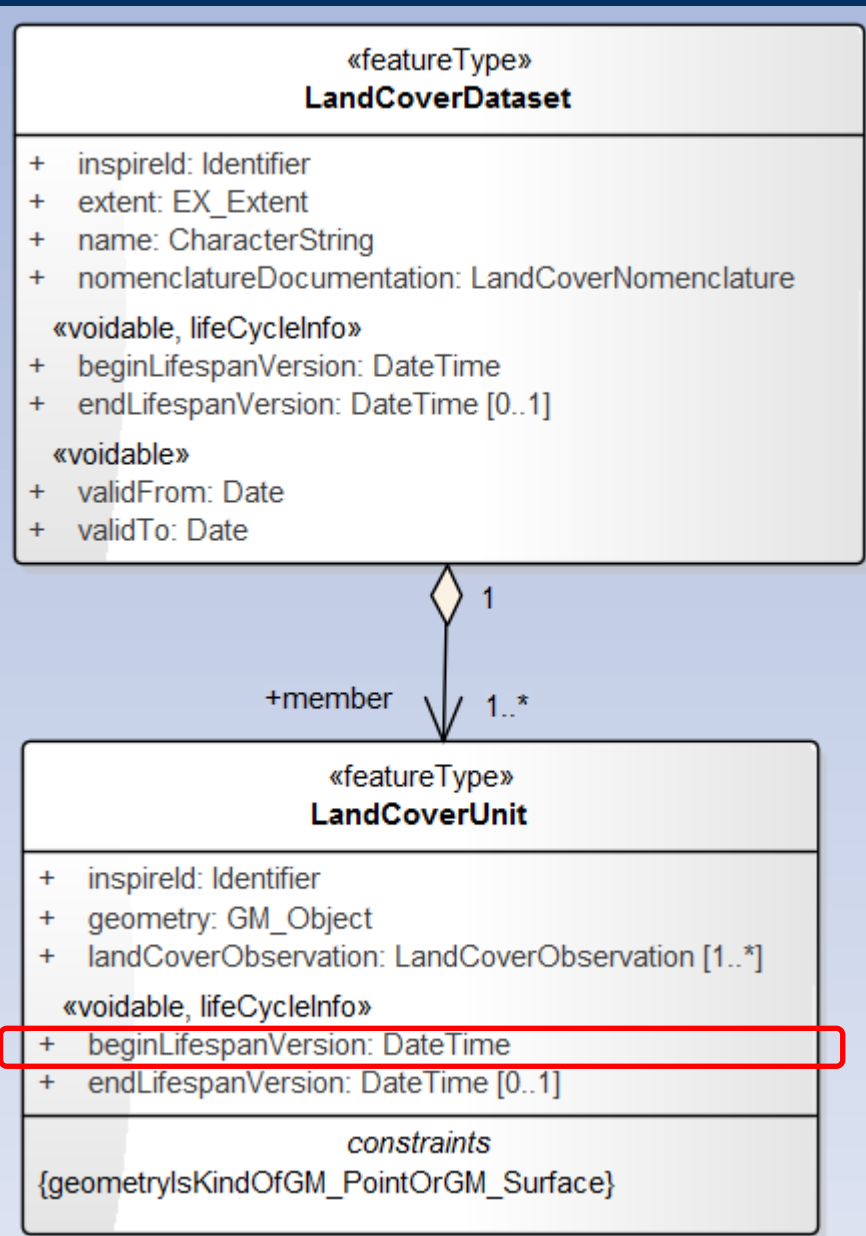

- **To Feature Class if object has geometry, object class if not**
  - Single geometry type, so mixed geometry to xxxP, xxxL, xxxS
- **Names limited to 30 characters**
  - **AdministrativeUnits::AdministrativeUnit becomes auAdmUnitS**
- **Attributes with a maximum multiplicity greater than one are converted into their own object class.**
  - Attribute values are associated through foreign key references (fields RID to IFCID).
  - Attribute “name” of AdministrativeUnits::AdministrativeUnit is converted to the object class auAdmUnitS\_name
- **Attributes that are voidable have additional field with the suffix “\_void” to distinguish unknown/unpopulated/missing**
- **Code Lists -> database domains + URL of reference list**
- ...

## Data themes - Dependencies and extensibility

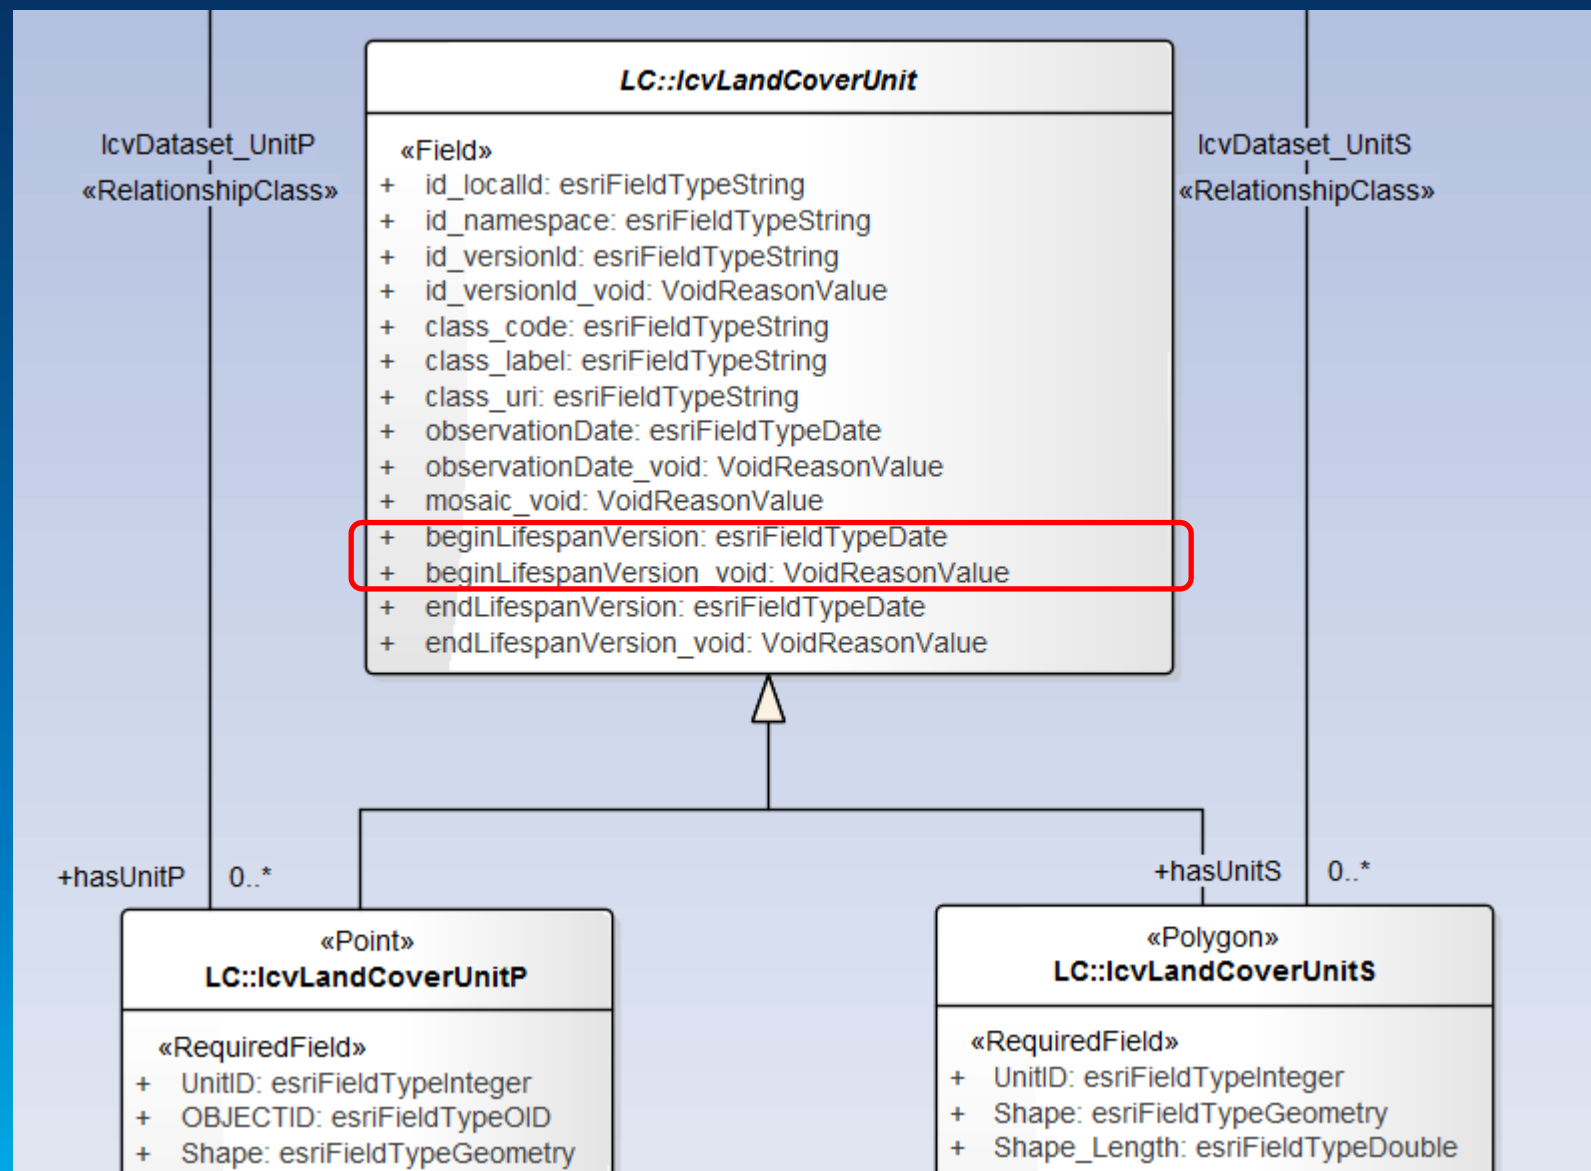

- **Dependencies: a data theme may depend on others:**
  - Mineral resources requires geology data theme, the UML and geodatabase implementation must consider this dependency
  - Annex I themes use common structures (network node)
- **Template versions and profiles**
  - INSPIRE Annex II/III introduced the concept of profile
  - ELF can be seen as a profile of INSPIRE
- **Data encoding and services**
  - INSPIRE GML application schemas + WFS 2.0 for INSPIRE download services
  - ATOM-based download services meet user expectations and early INSPIRE compliance
  - Beyond INSPIRE - Esri REST services (e.g. data reviewer, online/off-line editing, analysis)

### 11.3 Styles recommended to be supported by INSPIRE view services

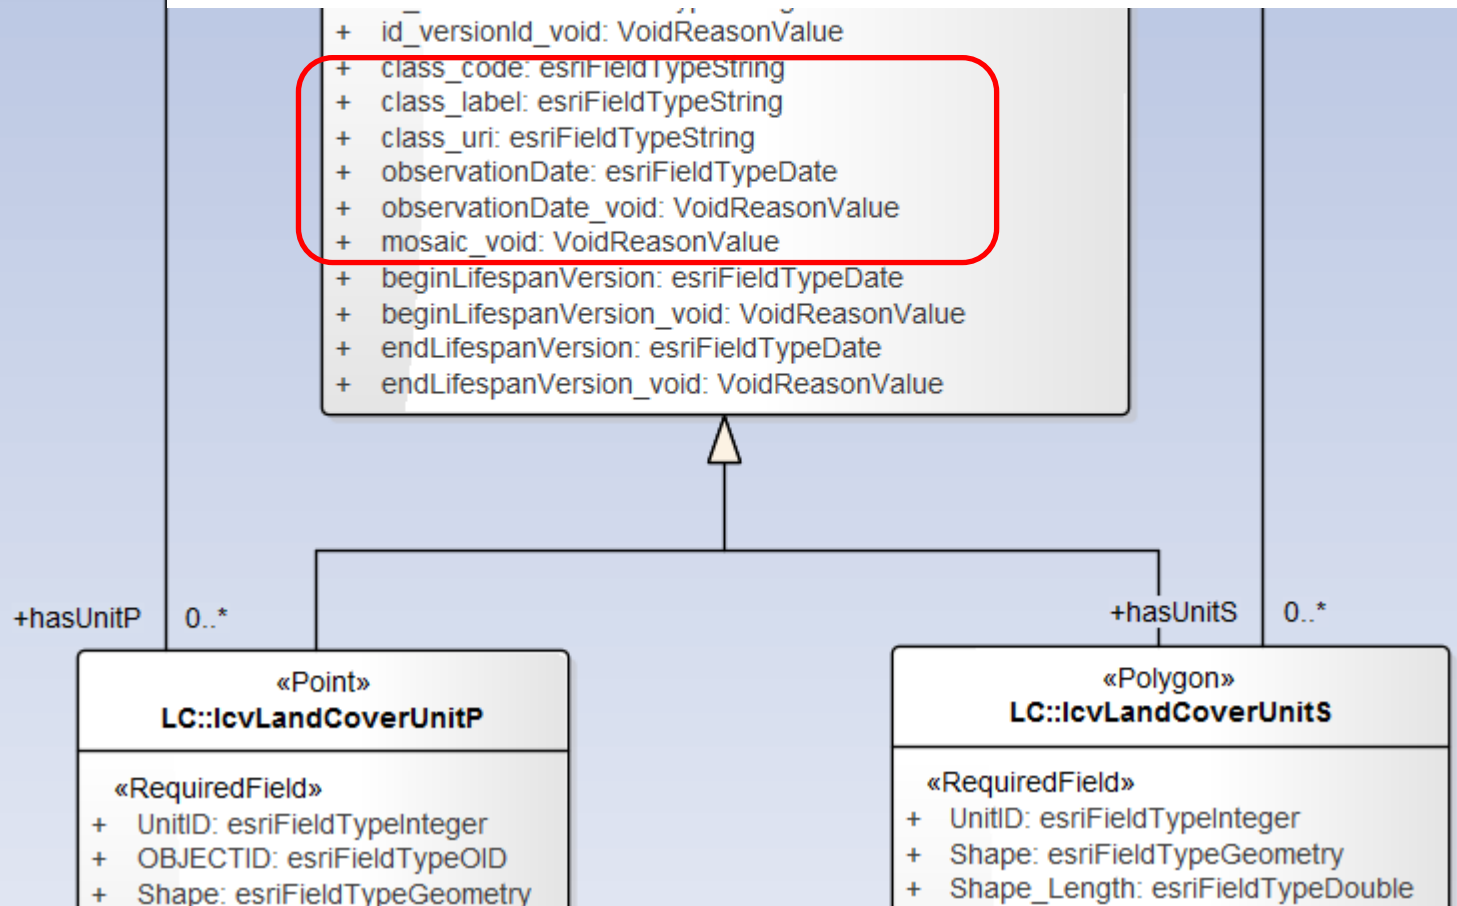

As this specification is generic and does not require the usage of a specific nomenclature, the previous default styles only represent the geometries supporting Land Cover information and not the information itself. It is however recommended that WMS servers implement styles that allow :

**Recommendation 1** For Land Cover data supported by surfaces/polygons (and modelled in this specification through a collection of LandCoverUnit), it is recommended that surfaces are represented by polygons with a color (corresponding to the legend) fill and a black outline (#000000) of 3 pixels width.

Example : for CORINE Land Cover (Cf. Annex C.3.1 for CORINE Land Cover colors), polygons are filled with RGB colors corresponding to the code from the attribute valueId associated to each surface geometry in the GeometryValuePair.
